ARTICLE NO. RC976622

Electrolyzed-Reduced Water Scavenges Active Oxygen Species and Protects DNA from Oxidative Damage

“ERW with high pH and significant negative ORP was shown to have SOD-like (SUPEROXIDEDISMUTAZ) activity and CATALASE-like activity, and thus, scavenge active oxygen species and protect DNA from damage by free radicals in vivo”

Received March 24, 1997

Active oxygen species or free radicals are considered to cause extensive oxidative damage to biological macromolecules, which brings about a variety of diseases as well as aging. The ideal scavenger for active oxygen should be ‘active hydrogen’. ‘Active hydrogen’ can be produced in reduced water near the cathode during electrolysis of water. Reduced water exhibits high pH, low dissolved oxygen (DO), extremely high dissolved molecular hydrogen (DH), and extremely negative redox potential (RP) values. Strongly electrolyzed-reduced water, as well as ascorbic acid, (/)-catechin and tannic acid, completely scavenged $O_2^{\bullet}$ produced by the hypoxanthine-xanthine oxidase (HX-XOD) system in sodium phosphate buffer (pH 7.0).

Anticancer Effect of Alkaline Reduced Water

Kyu-Jae LEE^{1,2}, Seung-Kyu PARK^{1,2}, Jae-Won KIM¹, Gwang-Young KIM¹, Young-Suk RYANG⁵, Geun-Ha KIM¹, Hyun-Cheol CHO³, Soo-Kie KIM^{2,3}, and Hyun-Won KIM^{2,4}

¹ Dept. of Parasitology, ² Institute of Basic Medical Sciences, ³ Dept. of Microbiology, ⁴ Dept. of Biochemistry, Wonju College of Medicine, Yonsei Univ. (Wonju , Korea) ⁵Dept. of Biomedical Laboratory Science and Institute of Health Science, College of Health Science, Yonsei Univ. (Wonju , Korea)

Alkaline reduced water (ARW) showed significant anticancer effect.

When B16 melanoma cells were inoculated subcutaneously and intra-peritoneally, C56BL/6 mice fed with ARW showed tumor growth delay and the survival span was significantly lengthened. ARW also showed the inhibition of metastasis by reducing the numbers of B16 melanoma colonies when injected through tail vein.

Reactive oxygen species (ROS) or free radicals are one of the major offenders to render oxidative damage to biological macromolecules. These unstable ROS are known to cause or aggravate a variety of incurable diseases such as cancer, cardiovascular diseases, neurodegenerative diseases as well as aging ^{1, 2} The cellular radical-scavengers such as superoxide dismutase, catalase, glutathione peroxidase are natural defense system against ROS.

Life Science. 2006 Nov 10;79(24):2288-92. Epub 2006 Aug 2.

Anti-diabetic effects of electrolyzed reduced water in streptozotocin-induced and genetic diabetic mice.

Kim MJ, Kim HK. Department of Obesity management, Graduate School of Obesity Science, Dongduk Women's University, 23-1 Wolkukdong, Seoul, 136-714, South Korea. mijakim@dongduk.ac.kr

Oxidative stress is produced under diabetic conditions and is likely involved in progression of pancreatic beta-cell dysfunction found in diabetes. Both an increase in reactive oxygen free radical species (ROS) and a decrease in the antioxidant defense mechanism lead to the increase in oxidative stress in diabetes. Electrolyzed reduced water (ERW) with ROS scavenging ability may have a potential effect on diabetic animals, a model for high oxidative stress. Therefore,

ERW, provided as a drinking water, significantly reduced the blood glucose concentration and improved glucose tolerance in both animal models.

blood insulin levels in STZ-diabetic mice whereas blood insulin level was markedly increased in genetically diabetic db/db mice. This improved blood glucose control could result from enhanced insulin sensitivity, as well as increased insulin release. **The present data suggest that ERW may function as an orally effective anti-diabetic agent and merit further studies on its precise mechanism.**

Biomed Res. 2009 Oct;30(5):263-9.

Electrolyzed-reduced water inhibits acute ethanol-induced hangovers in Sprague-Dawley rats.

Park SK, Qi XF, Song SB, Kim DH, Teng YC, Yoon YS, Kim KY, Li JH, Jin D, Lee KJ. Department of Environmental Medical Biology, Wonju College of Medicine, Yonsei University, Wonju, Gangwon, Republic of Korea.

Ethanol consumption disturbs the balance between the pro- and anti-oxidant systems of the organism, leading to oxidative stress. Electrolyzed-reduced water (ERW) is widely used by people in East Asia for drinking purposes because of its therapeutic properties including scavenging effect of

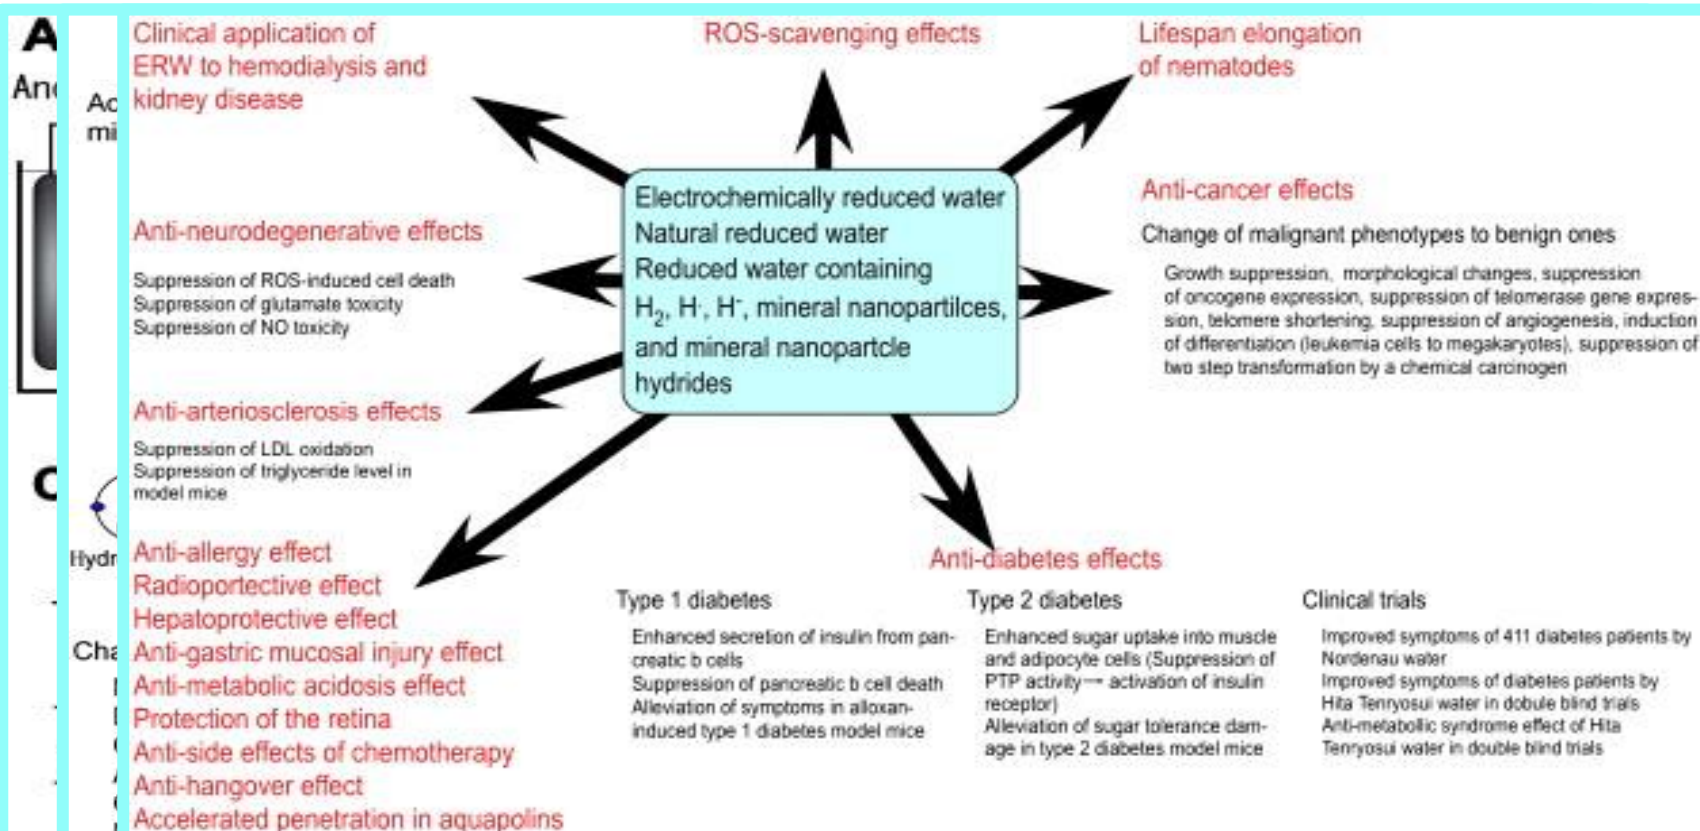

Drinking ERW has an effect of alcohol detoxification by antioxidant mechanism and has potentiality for relief of ethanol-induced hangover symptoms.

aminotransferase and alanine aminotransferase in serum was markedly decreased 24 h after pre-oral administration of ERW. Moreover, oral administration of **ERW significantly activated non-enzymatic (glutathione) and enzymatic (glutathione peroxidase, glutathione-S-transferase, Cu/Zn-superoxide dismutase and catalase)** antioxidants in liver tissues compared with the control group. **These results suggest that drinking ERW has an effect of alcohol detoxification by antioxidant mechanism and has potentiality for relief of ethanol-induced hangover symptoms.**

- Step 4 - Rinse thoroughly with pH 4-6 mildly acidic water.
- Step 5 - Heavily mist or flood the wound, cut or scrape and surrounding area with enough pH 2.5 strongly acidic water. Let stand 1 minute then gently pat dry with a cotton pad.
- Step 6 - Heavily mist or flood the area with pH 11.5 alkaline/antioxidant water. Air dry or gently pat with sterile cotton pads.
- Step 7 - Thoroughly mist with pH 4-6 mildly acidic water stored in a glass bottle and equipped with a fine spray mister.
- Step 8 - Dress with gauze pad or bandage.
- Step 8 - Repeat morning and before bedtime for scrapes and minor cuts. For deeper or in case of infection it may be necessary to repeat Steps 2, 4 and 5 up to 6 times per day.
- Step 9 - Mist lightly with pH 4-6 mildly acidic water 2-4 times per day to keep the areas hydrated but not moist.

DIAPER RASH

Preventing diaper rash begins by making certain that your baby is properly hydrated with pH 8.5-9.5 alkaline drinking water. Next replace baby wipes with a container filled with soft cloths or unleached paper towels lightly saturated with mildly acidic water. To create antimicrobial wipes blend 15 drops of lavender essential oil to 1/2 cup of mildly acidic water to dampen the wipes. Use to cleanse diaper area each time you change your baby, pat dry and then apply a very fine mist to the skin. This assists in keeping the pH of the skin balanced. To treat diaper rash follow the steps outlined below.

- Step 1 - Cleanse with non-soap cleanser and pH 4-6 mildly acidic water & pat dry
- Step 2 - Saturate a cotton pad with pH 2.5 strongly acidic water and apply to the rash, paying special attention to any broken skin. Let stand for at least 1 minute or until dry.
- Step 3 - Saturate a cotton pad with pH 11.5 strongly alkaline water and apply liberally to the rash and any areas of open skin.
- Step 4 - Hydrate the skin with pH 4-6 mildly acidic water stored in a glass bottle fitted with a fine spray mister.
- Step 5 - Repeat after each diaper change. Diaper rash begins with urine and feces that are too acidic.

ECZEMA AND PSORIASIS

- Step 1 - Rinse with pH 11.5 highly alkaline water to remove excess oils from the skin. Take time to soak areas that have formed a clear "crust" as a result of weeping. Dab, without rubbing, until the areas are completely clear.
- Step 2 - Cleanse with a very mild non-soap cleanser and pH 4-6 mildly acidic water.
- Step 3 - Rinse thoroughly with pH 4-6 mildly acidic water & gently pat dry with a lint free towel.
- Step 4 - Saturate a cotton ball with pH 2.5 strongly acidic water and generously apply to any areas of broken skin. This step is essential to reduce the chance of contracting a secondary staph infection. After 1 minute, very gently pat dry with a lint free towel.

- Step 5 - Heavily mist or rinse affected areas with pH 11.5 highly alkaline water to allow to air dry or pat dry with a clean, lint free towel after 1 minute.
- Step 6 - Rinse with pH 4-6 mildly acidic water stored in a glass bottle and equipped with a fine spray mister. Allow to naturally air dry.
- Step 7 - In mild cases, repeat morning and bedtime 3-4 times per day.
- Step 8 - Mist with the pH 4-6 mildly acidic water 2-4 times per day to keep the areas hydrated but not moist.

HERPES TYPE 1 & 2

The best treatment for oral or genital herpes is immediate treatment at the onset of an outbreak. Speedy treatment can actually stop an outbreak before it erupts. Following the Basic Water Protocol is your best insurance.

- Step 1 - Early treatment starts with pH 2.5 strongly acidic water. Soak a cotton swab and apply to the skin anywhere you have that "tingling" sensation. Leave on skin for at least 1 minute.
- Step 2 - Follow with pH 11.5 strongly alkaline water to remove oxidative damage to the affected areas. Leave on skin for at least 1 minute or until dry.
- Step 3 - Finish by misting the areas with pH 5.5 mildly acidic water and let air dry.
- Step 4 - Repeat hourly during the first day of symptoms.
- Step 5 - If symptoms persist after 24 hours, repeat 6-8 times per day.

RASHES & CONTACT DERMATITIS

Rashes and contact dermatitis are both very uncomfortable and even unintentional scratching can open the door to unwanted infections. So treating rashes at the earliest onset is a great way to block the rash from spreading and prevent infection. However, rashes can appear rapidly leaving treatment to reduce red, itchy skin as your only option.

- Step 1 - The first step is generally to remove any potential allergens that could be causing the rash or contact dermatitis; changing the pH and temperature of the skin in the case of heat rash. Thoroughly cleanse area with a solution of 1 part mild non-soap and 10 parts pH 11.5 highly alkaline water.
- Step 2 - Rinse thoroughly with pH 4-6 mildly acidic water.
- Step 3 - If any lesions or open skin appears, follow up with pH 2.5 water applied with a spray bottle or a saturated cotton pad.
- Step 4 - Follow by flooding area with pH 11.5 highly alkaline water then pat dry.
- Step 5 - Finish by misting the affected areas with pH 5.5 mildly acidic water.
- Step 6 - Repeat 2-6 times per day and mist with pH 5.5 mildly acidic water as often as necessary to relieve the discomfort.

Kangen Water pH 2.5 was used in many Japanese hospitals for healing of varieties of skin conditions, e.g. Eczema. Patients were advised to drink Kangen Water daily and used acidic water to bathe the affected areas.

After 2 weeks, the vesicles dried up. The Eczema was completely cleared out without any relapse.

22 yıldır süren püstüler sedef hastalığı (*Püstüler psoriasis, yaygın formu türü, Von Zumbusch püstüler psoriasis olarak da bilinen türüdür*). Ateşlenme ile başlıyor kol altı ve bel bölgelerinden başlayarak hızla vücuda yayılıyor ve iltihap benzeri nokta şeklinde lezyonlar oluşuyor. Ölümle sonuçlanabilen bir sedef türüdür.

Yaptığım uygulama: Oluşan lezyonların üzerine 2,5pH (hipokloröz asit) ile püskürtme yaptım. Bunun nedeni Lezyonlar deride oluştuğunda mikrobik değil, fakat kuruyup çatlayan derinin enfeksiyon kapmasını önlemek amacıyla, biraz sonrasında 6 pH (tonik) püskürtme yapıldı, bu da sertleşen deriyi yumuşak tutmak için. Bu uygulama 2 saatte bir yapıldı. Aynı zamanda 3 litre/gün 9,5pH antioksidan iyonize su içildi. Tüm vücut lezyon oluşumu ve deri dökülmesinin tamamlanması yaklaşık 3 hafta sürdü.
